

Hydropath tips the scale

ROBINSONS soft drinks factory in Norwich, which is a hard water area, has improved production efficiency thanks to a Hydropath water conditioning system on the Fruit Spring line.

The Hydroflow unit prevents the build up of limescale on the heat exchangers of the pasteurising system.

Hydropath believes it is the first Hydroflow installation intended to protect a water and product system.

No longer does production have to stop for descaling every two to three weeks, which took a full day at considerable production expense.

Hydroflow works by emitting randomly varying electric fields throughout the system. This acts

upon the bicarbonates in solution to cause suspended crystallisation, which is washed away with the flow

and during blow down.
